Mountain Weather Forecast

Ground Conditions Supplement

Date: Sunday 18 December 2022 Location: Catstye Cam summit at 10:46. Full report: A windy day in the fells with powerful and unpredictable gusts in excess of 60 mph over high and exposed ground. The snowline this morning above Glenridding was at around 400m, however, after yesterday's thaw at low and mid elevations, a lot more ice was present on the paths, as well as around drainage lines. Walking poles and/or microspikes are recommended. Many upland tarns and other water features are frozen over and with fresh and windblown snow on top of the ice, some of them may be difficult to identify. Strong southwesterly winds have scoured many south-facing slopes and redistributed the existing snow, predominantly onto the north and east-facing slope aspects, where, above roughly 700m knee-deep drifts have accumulated as windslab. The strong winds today meant that snow and ice pellets were windborne and making progress into the wind was particularly arduous. Goggles are extremely useful both for comfort and for navigating safely in these conditions. Swirral and Striding Edge are both in full winter condition, however, snow cover is relatively lean and unconsolidated meaning that there is still plenty of snowed-up and exposed rock to negotiate. Full winter clothing (warm and waterproof) including hats and gloves, a map and compass as well as a headtorch are all essential for anyone venturing into the hills. Microspikes and/or walking poles are recommended and for anyone attempting steep and exposed routes such as the Helvellyn edges, an ice axe and crampons should be carried. Temperature: minus 2.3 C, Maximum wind speed 60.2mph, Wind chill: minus 12.3 C, Average wind speed: 31.4 mph
